1 Introduction

This supplement corresponds to the macroeconomic agent-based model “Mak(h)ro_0” which is implemented in ML3 and SESSL [1] and serves as a guidance document between the model description [Citation follows] and simulation environment. The purpose of the model is to provide a baseline simulation model that will support studies to compare different monetary systems concerning their macro-financial stability features.

2 Model variables and parameter

2.1 Variables

The model variables with their corresponding initial values are arranged by agent-type and listed in the ML3-file between lines 1 to 125. Tables 2, 3 and 4 present the main variables, giving a short description and the symbol used in the model description [citation].

2.2 Parameter

The model parameters with their corresponding baseline values are arranged by model entities and listed in the ML3-file between lines 146 to 192 and in the scala-file (SESSL) between lines 26 and 92. Tables 5 and 6 present all parameters, giving a short description and the symbol used in the model description [citation].

3 ML3 code arrangement

To combine the model description [citation] with the model implementation in ML3, the provenance model (Figure 3 [citation]) serves as a template. Table 7 gives an overview of the entities' code locations. ML3-Rules which are specifically related to accounting can be found in lines 444 - 525 for firms and lines 1,156 - 1,181 for banks. The interbank experiment can be found in lines 1,442 - 1,515.

4 Validation

The validation outcome presented in Section 5 of the model description [citation] has been conducted with R. The corresponding R-scripts are provided in the repository and need to be adapted with respect to the working directory and path to the simulation outcome. The R-scripts are named according to the stylized facts (SF) used for the validation. The relative standard deviations, mentioned in Section 5.1 (SF1), are calculated in the R-Script “SF3_cross_macro” (lines 249 ff.). The representative simulation run as stated in SF1, SF2, SF4, SF6, SF9, and SF10, is named “run-0.csv” in the corresponding repository folder (Simulation replications). The other stylized facts have been produced using all 20 simulation replications combined in a data frame that spans 12,000 periods (without the warm-up phase of 200 periods for each simulation replication).

Interbank market experiment (SF13) To replicate the interbank experiment (lines 1,442 - 1,515 in ML3) the variable “nowness” has to be added to the variable list for the Central Bank (lines 94 ff. in ML3) and the open market transaction mechanism (lines 1276 - 1297 in ML3) has to be deactivated. It is recommended to use at least three replications (line 18 in SESSL), since the interbank rate at the start of the experiment phase, around period 50, can be disrupted by excessive bank lending. This effect occurs because the Central Bank has no control

Table 2: Variables Mak(h)ro.0

ML3 ^a	Symbol ^b	Description	Initial value ^c
Goods market			
<i>Firm</i>			
price	p_i	price of a good	1
targetProduction	$Y_i^{T'}$	target production	-
demand	D_i	total demand of a good per period	1
inventory	N_i	stock of produced goods	50
liquidity	Liq_i	firm cash at bank deposit	100
turnover	-	total sales of produced goods per period	-
equity	E_i	equity at bank deposit	100
debt	Lib^d	loan liabilities and withdraw facility	-
wage	-	wage costs per employee	2
profitAfterTax	-	earnings after taxes	-
consumptionUnit	q_i^C	real consumption sales (in good units)	-
consumption	-	nominal consumption	-
<i>Household</i>			
wealth	Liq_h	financial wealth or bank deposits	2
<i>Government</i>			
debt	D_g	debt account	-
liquidity	Liq_g	liquidity account	-
Investment market			
investment	inv_i^e	investment amount in investment strategy	10
investmentConsumeUnit	q_i^I	real investment sales (in good units)	-
investmentConsume	-	nominal investment sales	-
investmentAmount	-	investment amount consumed	10
investmentTurnover	-	investment sales of produced goods	1
investmentCosts	-	investment purchase of produced goods	-

^a Variable definition in ML3 code.^b Variable definition in model description (*citation follows*).^c Variable value in ML3 code.^d ML3 code also includes withdraw facility.^e The investment target is also captured.

Table 3: Variables Mak(h)ro_0 (continued)

ML3 ^a	Symbol ^b	Description	Initial value ^c
Credit market			
<i>Firm</i>			
depositProfit	-	deposit interest earnings	-
<i>Bank</i>			
equity	E_b	equity level	10
liquidity	R_{bc}	liquidity level at Central Bank account	10
margin	m_b	interest mark-up	0.01
creditDemandLeverage	-	credit demand without firm solvency weighting	-
creditDemandSolvency	-	credit demand with firm solvency weighting	-
riskLevel	v_b	risk level	1
<i>Central Bank</i>			
keyRate	i_c	main refinancing operation	0.01
priceInflation	-	nominal inflation indicator	-
demandInflation	-	sum of sold goods within the economy	-
inflationBasis	-	inflation identification of previous inflation measurement	2

^a Variable definition in ML3 code.^b Variable definition in model description (*citation follows*).^c Variable value in ML3 code.

Table 4: Variables Mak(h)ro_0 (continued)

ML3 ^a	Symbol ^b	Description	Initial value ^c
Interbank market			
<i>Bank</i>			
depositMargin	-	deposit interest mark-up	0.0001
interbankMargin	im_b	interbank interest mark-up	0.01
depositDemand	-	deposit demand by households and firms	-
reservesDemand	RD_b	reserve demand by banks with a shortage of reserves	-
basisMoney	R_b	reserves	100
reserveRequirement	-	defines reserves amount in relation to fraction of deposits	105
centralLoan	-	loan liabilities to the Central Bank	-
interbankVolume	-	transaction volume of reserves between banks	-
centralCosts	-	interest costs of Central Bank loans	-
interbankCosts	-	interest costs of interbank loans	-
interbankProfit	-	interest profits of interbank loans	-
<i>Central Bank</i>			
basisMoney	R_{cb}	reserves	-
lendingFacility	-	lending facility	-

Table 7: Mak(h)ro_0 code line location in ML3 by entities

Note: Link between provenance model (Figure 3 [citation]) and ML3 code location.

Entity	Code line location in ML3
Real economy	195 - 530
Goods market	196 - 338
goods supply	199 - 261
labor market	262 - 280
goods demand	281 - 310
bankruptcy	311 - 342
Investment market	343 - 443
investment cycle	347 - 413
investment demand	414 - 441
fiscal	1,367 - 1,388
Financial sector	531 - 1,366
Credit market	535 - 909
credit demand	538 ff.
credit supply	550 - 883
bank bailout	884 - 909
Monetary system	910 - 1,229
interbank	916 - 1,229
monetary policy	1273 - 1,366

over the interbank rate in the experiment phase. The stop time (line 22 in SESSL) needs to be set to 150.
